

Parc Cwm Darran Audio Trail Script

3. Northern Boundary

Yeah, this is the northern boundary of the colliery. This is where the sidings, when I mean sidings, is where they stored the empty trucks so that they could be filled with coal from the Washery and transported to wherever it was required; mainly for the steel industry as coking coal – taken up to the north-west of England, to a place called Workington

But as Mike goes on to explain, it wasn't just coal they were extracting from the ground.

Ogilvie was producing about 400,000 tonne a year, saleable coal. And it was only about a 52% vend so 48% between 3400,000 tonne went up there. And that was for 50 years like.

Look to your right. The trees on the steep valley-side that you see growing here were planted in shale, or 'colliery spoil' and the valley side is much higher than at the start of the 20th century. As you will hear at stop 9 it was a huge operation to transport the 'spoil' onto the mountainside and because not every colliery had a washery, spoil from other sites, such as the local 'Britannia' colliery, was also brought here too.

At stop 4 we will meet up with Park Ranger Pete Lewis to explain some of the management that takes place today.

Continue ahead in the direction you came keeping in between the white lines. Listen to track 4 besides the second bench you reach on your right.
